

TESTWORK DEVELOPMENT

Testwork is the vital first step in new product development, or the prelude to volume production, in which parameters will be set not only to achieve optimum product quality but also optimum efficiency in the design and operation of the drying plant.

Drytec has unmatched experience of testwork, handling experimental quantities as small as 1 kilogram for customers in the UK and Europe.

Our innovative ideas and comprehensive equipment are all part of the service we offer, with a range of atomisers that includes centrifugal disc, high pressure nozzle and 2-fluid nozzle. As you would expect, Drytec has in-house design and engineering facilities to adapt or create equipment in response to customers' demands.

We can also arrange to set up testwork equipment on hire in customers' own premises.
